What Is Claimed Is:

1 1. A transflective liquid crystal display device having 2 various cell gaps, comprising: 3 a first substrate having a transmissive region and a 4 reflective region thereon; 5 an array of pixel driving elements formed on the first 6 substrate in the reflective region; 7 an insulating layer formed on the first substrate to cover the array of pixel driving elements; 8 a passivation layer formed on the insulating layer in the 9 10 reflective region, wherein a top surface of the 11 passivation layer is higher than a top surface of 12 the insulating layer; conformal 13 reflective electrode a formed the 14 passivation layer, wherein the reflective electrode 15 electrically connects the array of pixel driving 16 elements; 17 conformal transparent electrode а formed on the 18 insulating layer, wherein the transparent electrode 19 electrically connects the array of pixel driving 20 elements; a color filter layer formed on the reflective electrode 21 22 and the transparent electrode, wherein a first thickness of the color filter layer in the 23 24 reflective region is smaller than a second thickness 25 of the color filter layer in the transmissive 26 region; 27 a second substrate opposite the first substrate;

Client's ref.: ERSO-910063/陳志強等 File:0412-8910USF/Jacky/Steve

- a common electrode formed on an inner side of the second substrate;
- a liquid crystal layer interposed between the first substrate and the second substrate; and
- a transparent organic element bridging a gap in the liquid 32 crystal layer between the first substrate and the 33 second substrate, formed on the common electrode in 34 35 the reflective region, wherein one end of the 36 transparent organic element shores up the color 37 filter layer, thus a third thickness of the gap in 38 the reflective region is smaller than a fourth thickness of the gap in the transmissive region. 39
- 1 2. The transflective LCD device according to claim 1, 2 wherein the array of the pixel driving elements is an array of 3 thin film transistors (TFTs).
- 3. The transflective LCD device according to claim 1, wherein the transparent electrode is an ITO (indium tin oxide) layer or an IZO (indium zinc oxide) layer.
- 1 4. The transflective LCD device according to claim 1, 2 wherein the reflective electrode is an aluminum layer or a 3 silver layer.
- 5. The transflective LCD device according to claim 1, wherein the common electrode is an ITO (indium tin oxide) layer or an IZO (indium zinc oxide) layer.
- 1 6. The transflective LCD device according to claim 1, wherein the transparent organic element has an angular shape.

1	7. A method of fabricating a transflective liquid
2	crystal display device having various cell gaps, comprising the
3	steps of:
4	providing a first substrate having a transmissive region
5	and a reflective region thereon;
6	forming an array of pixel driving elements on the first
7	substrate in the reflective region;
8	forming an insulating layer on the first substrate to
9	cover the array of pixel driving elements;
10	forming a conformal transparent electrode on the
11	insulating layer, wherein the transparent electrode
12	electrically connects the array of pixel driving
13	elements;
14	forming a passivation layer on the insulating layer in the
15	reflective region, wherein a top surface of the
16	passivation layer is higher than a top surface of
17	the insulating layer;
18	forming a conformal reflective electrode on the
19	passivation layer, wherein the reflective electrode
20	electrically connects the array of pixel driving
21	elements;
22	forming a color filter layer on the reflective electrode
23	and the transparent electrode, wherein a first
24	thickness of the color filter layer in the
25	reflective region is smaller than a second thickness
26	of the color filter layer in the transmissive
27	region;
28	providing a second substrate opposite the first
29	substrate;

41

42

- forming a common electrode on an inner side of the second substrate;
- forming a transparent organic element on the common 32 electrode in the reflective region for bridging a 33 gap in a liquid crystal layer between the first 34 35 substrate and the second substrate, wherein one end 36 of the transparent organic element shores up the color filter layer, thus a third thickness of the 37 38 gap in the reflective region is smaller than a fourth 39 thickness of the gap in the transmissive region; and filling a space between the first substrate and the second 40
- 1 8. The method according to claim 7, wherein the array 2 of the pixel driving elements is an array of thin film 3 transistors (TFTs).

liquid crystal layer.

substrate with liquid crystal molecules to form the

- 9. The method according to claim 7, wherein the transparent electrode is an ITO (indium tin oxide) layer or an IZO (indium zinc oxide) layer.
- 1 10. The method according to claim 7, wherein the 2 reflective electrode is an aluminum layer or a silver layer.
- 1 11. The method according to claim 7, wherein the common 2 electrode is an ITO (indium tin oxide) layer or an IZO (indium 3 zinc oxide) layer.
- 1 12. The method according to claim 7, wherein the 2 transparent organic element has an angular shape.
